filial AN SSSR (Urals Branch, AS USSR), the Institute of Biophysics, AS USSR, in conjunction with the Vsesoyuznyy nauchno-issledovatel'skiy institut vitaminnoy promyshlennosti (All-Union Scientific Research Institute of the Vitamin Industry) studied the irradiation of various varieties of radish seeds. In all cases an increase of 11 - 28% in the root yield and a 5 - 6 day acceleration in root ripening were noted. The optimum radiation doses were 500 and 1,000 r. Presowing irradiation of tomatoes carried out by the Urals Branch, AS USSR, the L'vov University and the Institute of Biophysics, AS USSR, accelerated ripening of the fruits and increased the yield by 27 - 45%. Irradiation of sprouting seeds gave an increase in the fruit yield of up to 66%. This method should be subjected to all-round research since in almost all cases it gave higher indices than with irradiation of dry seeds. The presowing irradiation of carrots by the Institute of Biophysics, AS USSR, in conjunction with the All-Union Scientific Research Institute of the Vitamin Industry and L'vov University showed that this crop had a high resistance to radiation and that irradiation gave an increase in the root yield of

D298/D303

conference was attended by 96 specialists from 38 scientific research institutions and training institutes. The papers summarized research on the presowing irradiation of the seeds of various agricultural crops. In all cases a rise in yield, acceleration of maturation, and an increase in seed germination were noted. Generalization of the research data on maize obtained over a period of years in the Ukrainskiy institut fiziologii rasteniy (Ukrainian Institute of Plant Physiology), the Sibirskiy botanicheskiy sad Zapadnosibirskego filiala AN SSSR (Siberian Botanical Gardens of the West Siberian Branch, AS USSR), the Institut biologii AN Latviyskoy SSR (Institute of Biology, AS Latviyskaya SSR), the L'vovskiy universitet (L'vov University), the Institut genetiki i selektsii AN Azerbaydzhanskoy SSR (Institute of Genetics and Selection, AS Azerbaydzhanskaya SSR) and the Institute of Biophysics, AS USSR, showed that gamma-irradiation of dry maize seeds in doses of 500 p to 4 kr stimulates its growth and development, gives an increase in grain yield of 10 - 18% and of green mass from 5 - 28%. An account of various individual studies of this problem is given. The Institute of Biology of the AS Latviyskaya SSR, the L'vov University, the Ural'skiy

TITLE: Chronicle. Presowing gamma-irradiation of the seeds  
of agriculture crops

PERIODICAL: Radiobiologiya, v. 1, no. 4, 1961, 636-638

TEXT: The article presents the results of the Soveshchaniye po  
predposessnomu oblucheniyu semyan sel'skokhozyaystvennykh kul'tur  
(Conference on the Presowing Irradiation of the Seeds of Agricultural  
Crops), convened by the Institut biologicheskoy fiziki AN SSSR (Institute  
of Biophysics, AS USSR) in conjunction with the Sovet po ispol'zovaniyu  
atomnoy energii v sel'skom khozyaystvye VASKhNIL (Council on the Use of  
Atomic Energy in Agriculture, VASKhNIL) on February 20-23, 1961, in  
Moscow. The conference was convened by the Laboratoriya radiobiologii  
(Laboratory of Radiation Biology) of the Institute of Biophysics, AS  
USSR, to summarize research on the effects of the presowing of seeds on  
the growth, development and biochemical composition of plants. The

Rol' perekisey i kisloroda v nachal'nykh stadiyakh radiobiologicheskogo effekta (Role of Peroxides and Oxygen During Primary Stages of Radiobiological Effects) Moscow, 1960. 157 p. 4,500 copies printed.

Responsible Ed.: A. M. Kuzin, Professor; Ed. of Publishing House: K. S. Trincher; Tech. Ed.: P. S. Kashina.

PURPOSE : This collection of articles is intended for scientists in radiobiology and biophysics.

COVERAGE: Reports in the collection deal with the role of peroxides and oxygen in the primary stages of a radiobiological effect. They were presented and discussed at a symposium held December 25-30, 1958, organized by the Institut biofiziki AN SSSR, (Institute of Biophysics, AS USSR). Twenty-eight Moscow scientists, radiobiologists, radiochemists, physicists, and

diminished during the first 15 - 20 seconds and increased rapidly thereafter. The authors suppose that data obtained on the distribution of the dew and of the galvanic depositions assert the theory that electropolishing is a process of electric decrystallization. There are 7 bibliographical titles.

TITLE: On the Structure of an Electropolished Surface<sup>26</sup>

PERIODICAL: Tr. Kazansk. khim.-tekhnol. in-ta, 1958, Nr 22, pp 60 - 70

ABSTRACT: To investigate the structure of an electropolished Cu surface, the authors used the "dew" method and applied extremely thin Cu depositions from acid electrolytes. When using the "dew" method, the specimens were cooled down to ~ 0°C after electropolishing<sup>28</sup> and drying. Then they were subjected to a slight steam blast. The distribution of the dew was observed under a microscope. Changes in luster during the electropolishing process were also observed. During the electropolishing process, specimens, preliminarily subjected to rolling, became rapidly brighter within the first 1.5 - 2 minutes. The luster of annealed specimens

Title : The Removal of Asphyxial Nerve Parabiosis by Means of the  
Action of Direct Current Anode

Orig Pub : Vestn. Leningr. un-ta, 1958, No 15, 133-139

Abstract : The nerve asphyxia was performed according to the method  
described in earlier work of the authors (Tr. Leningr.  
o-va yestestvoisp., 1935, 64, vyp. 3, 283). In the begin-  
ning of nerve asphyxiation, the phase of shortening of  
chronaxia was noted; later, the phase of its lengthen-  
ing. In the process of development of asphyxial parabio-  
sis in the altered part, a bi-phase change of lability

ABSTRACT: According to the method of Finikov [Ref 1] the author  
establishes the system of equations which determines a two-sided  
fiberable pair of congruences in a Lobachevskiy space related to  
homogeneous normalized coordinates. One of the equations  
combines the eccentricity and the asymmetry [Ref 1] of the  
congruence of common perpendiculars, the other equations combine  
focal distances, angles between the focal planes, distance  
between center and foot of the common perpendiculars etc.  
There are 3 Soviet references.

"Certain Theorems on the Two-sided Stratifiable  
Couples with Real Focal Surfaces," L. Ya. Berezina,  
Riga

Mat Sbor, Vol 33 (75), No 1, pp 101-110

States that the general eqs of a two-sided stratification of congruence couples have 6 forms. Notes that in 1943 S. P. Finikov expressed the coefs of the expansion of two of these forms in independent form by means of quantities that characterize the congruence of the general perpendiculars, and thus

271r83

obtained from one of the eqs of the stratification system the theorem of general character. Here the authoress expresses the coefs of expansion of the remaining 4 forms in independent form by means of quantities characterizing both congruences that form the couple. Thus obtains a number of new theorems. Presented 1 Aug 52.

"Stratifiable Couples Joined to the Parabolic  
Congruence of Total Perpendiculars," S. P. Finikov,  
Moscow

Mat Sbor, Vol 33 (75), No 1, pp 3-12

States that in the metric theory of stratifiable  
couples it is essential to refer the pair of cor-  
responding rays to a rectangular trihedron formed  
from the total perpendicular (normal) of the rays  
of the pair and from the two vectors perpendicular  
to it. Here the theory of stratifiable couples is

271577

connected with the peculiarities of the congruence  
of total perpendiculars. Ordinarily this congru-  
ence is assumed to be hyperbolic; hence the in-  
terest in parabolic congruence. Cites related  
work of L. Ya. Berezina (Iz Akad Nauk Latv SSR,  
Vol 8 (1951), pp 1317-1325). Presented 10 Oct 52.

Berezina, L. Ya. Some properties of evolute surfaces  
*Uspehi Matem. Nauk (N.S.)* 8, no. 3(55), 109-110 (1953)  
 (Russian)

Let  $R_1, R_2$  be the radii of principal curvature of a surface  $(\Sigma)$ ,  $R_1^i, R_2^i$  those of its evolute surfaces  $(\Sigma_i)$ ,  $i=1, 2$ , and  $\beta_i$  the angle between the normal to  $(\Sigma)$  and the lines of curvature of  $(\Sigma_i)$ ; then

$$\sin 2\beta_1 \sin 2\beta_2 = \frac{4(R_1 - R_2)^2}{(R_1^1 - R_2^1)(R_1^2 - R_2^2)},$$

$$(R_1^1 - R_2^1) \sin 2\beta_1 = 2(R_1 - R_2) \frac{\tan \psi_1}{\tan \psi_2},$$

$$(R_1^2 - R_2^2) \sin 2\beta_2 = 2(R_1 - R_2) \frac{\tan \psi_2}{\tan \psi_1}.$$

Here  $\tan \psi_i = R_i / \rho_{i2}$  ( $\rho_{12}, \rho_{22}$  = radii of geodesic curvature of the lines of curvature on  $\Sigma$ ). The  $\beta_i$  satisfy the equation

$R_1^i \sin^2 \beta_i + R_2^i \cos^2 \beta_i = k_n^i / K_i$ ,  
 where  $k_n^i$  is the curvature of the normal section to  $(\Sigma_i)$  in the direction of the normal to  $\Sigma$ ;  $K_i$  is the Gaussian curvature of  $(\Sigma_i)$ .

Burezina, L. Ya. Investigation of the passage of a general congruence of rays through an optical system by means of the method of the moving trihedron. Latvijas PSR Zinatnu Akad. Vestis 1952, no. 3 (56), 115-126 (1952). (Russian. Latvian summary)

This paper is written for physicists with an ordinary college training in mathematics and interested in geometrical optics. It gives a simple exposition of the elementary theory of rectilinear congruences in the  $\omega$ -notation; stress is laid on the transformation of one trihedron into another. Consideration of a congruence in a medium of refraction index  $n_1$  into a medium of refraction index  $n_2$  leads to the theorem of Malus and to formulas such as

$$\frac{n_2 \cos^2 i'}{r_a} = \frac{n_1 \cos^2 i}{r_a} = \frac{n_2 \cos i' - n_1 \cos i}{R},$$

$$\frac{n_2}{r_b} = \frac{n_1}{r_b} = \frac{n_2 \cos i' - n_1 \cos i}{R}.$$

Here  $i, i'$  are the angles which the incoming and the refracted rays  $r, r'$  make with the normal to the separation surface ( $\epsilon$ );  $R$  is the radius of curvature of that normal section of ( $\epsilon$ ) in the osculating plane of which lie  $r, r'$ ;  $R$ , the radius of curvature of that normal section of ( $\epsilon$ ) orthogonal to the first;  $r_a, r_b$  are the radii of curvature of the normal sections which the plane through  $r$  and  $r'$  carves into the incoming and refracted wave surfaces;  $r_a, r_b$  the radii of curvature of the normal sections orthogonal to these. The paper finishes with some remarks on homocentric pencils and on multiple refractions.

Some Results of Determination of the Turbulence Coefficient by the Ion-Impact Method (Linear Source)

series), in July 1954 (18 series), and in June 1955 (28 series). The values of K, obtained by different methods, were intercompared and the coefficient of correlation between them was determined. It turned out that the values of K determined by all three methods, in the main are concordant with each other. The empirical dependence of K on the index of stability of the air layer near the earth has been determined.

TITLE: Some Results of Determination of the Turbulence Coefficient  
by the Ion-Impact Method (Linear Source)

PERIODICAL: Uch. zap. Kirovskiy gos. ped. in-t., 1958, Nr 15, pp 12 - 21

ABSTRACT: Utilizing two portable X-ray-diagnostic devices arranged under natural conditions with a distance of 25 m, a linear ion source was established oriented perpendicularly to the direction of wind. At definite distances from the source, the concentration of ions was measured. From the obtained values of concentration, the coefficient of the turbulent exchange K was determined using the formula of V.B. Milin (RZhGfiz, 1956, Nr 12, 36049). At the same time, gradient-observations of temperature and velocity of wind in the layer of atmosphere near the earth were carried out for determining the values K by the methods of M.I. Budyko and D.L. Laykhtman. The work was performed in course of three years: in June 1953 (45 series of measurements), in January 1954 (4

The Determination of the Turbulence Coefficient by the Method of Artificially Starting Ions (Point Source)

number because their results are contradictory to the conclusions obtained from the rest of 38 observations. The main conclusions are as follows:

- 1) The coincidence of the values of  $k$  with  $k_1$  and  $k_2$  is satisfactory, which makes it possible to consider the method of artificially started ions as sufficiently reliable for determining the turbulence coefficient. Hereat,  $k$  better coincides with  $k_1$  than with  $k_2$ .
  - 2) The ratio  $k/u$  is very closely connected with  $\epsilon$ . The correlation coefficient is equal to -1.00.
  - 3) The coefficient  $\beta$  well correlates with  $u$  as well as with  $k_1$ , whereat the corresponding dependences markedly differ from the linearity.
- A great number of correlation tables and graphs are presented as well as regression equations. Some inaccuracies are found in the article. There are 10 references.

TITLE: The Determination of the Turbulence Coefficient by the Method of Artificially Starting Ions (Point Source)

PERIODICAL: Uch. zap. Kirovskiy gos. ped. in-t, 1958, No. 15, pp. 3-11

TEXT: The results of measurements are analyzed for determining the turbulence coefficient in the atmospheric layer  $k$  near the ground surface and the constant of ion vanishing  $\beta$  by artificially starting ions from a point source. Simultaneously, observations of the gradients of wind and temperature were performed. From these observations were determined: a) the stability parameter  $\Delta t/u^2$  ( $\Delta t$  is the difference in the temperature at two defined levels,  $u$  is the velocity of wind at the defined level), b) the Laykhtman parameter  $\xi$ , c) the values of the turbulence coefficient  $k_1$  according to the Laykhtman scheme, and  $k_2$ , according to the Budyko scheme. Altogether 43 observations were evaluated; 5 observations were excluded later from this number.

chloral hydrate by means of a ЧЛАНЕ 312 (TsLA PE-312) electronic polarograph was developed. KCl was used as a background. Oxygen was removed by addition of  $\text{Na}_2\text{SO}_3$ . Under such conditions, chloral hydrate gives a distinctly marked wave ( $E_{1/2} = -1.6 \text{ v}$ ). Dichloro acetaldehyde gives two waves ( $E_{1/2} = -1.1$  and  $-1.6 \text{ v}$ ). In mixtures of the two substances the  $-1.6 \text{ v}$  waves are superimposed, and the  $-1.1 \text{ v}$  of dichloro acetaldehyde appears distinctly only at a low content (5-10%) of chloral hydrate. With more than 50% chloral hydrate, its influence on the first wave of dichloro acetaldehyde must be taken into account. Fig. 2 shows the calibration curves. If the content of dichloro acetaldehyde is lower than 50%, the polarogram should be plotted with addition of a known amount of dichloro acetaldehyde. Errors of up to 13-14% may arise in this connection. As direct polarography of chlorine oil is not possible due to disturbing impurities, it is distilled off, and polarography is performed with the fractions 85-90°C and 90-95°C; the result is converted for the weighed portion of chlorine oil. The basis is 100 g of chlorine oil. The two fractions are weighed, and filled up to 100 ml with distilled water. 0.5-1.0 ml of the solution is mixed with 1 ml of saturated  $\text{Na}_2\text{SO}_3$  solution and 25 ml of 0.2 N KCl. Polarography is performed

TITLE: Polarographic determination of dichloro acetaldehyde in chlorination products of ethanol

PERIODICAL: Zavodskaya laboratoriya, v. 27, no. 3, 1961, 287-290

TEXT: Chloral, a chlorination product of ethanol, is used as initial material for the synthesis of chloroform (which is used for the production of fluoroplasts) and, together with dichloro acetaldehyde, for the synthesis of DDT and similar substances. The industrial chlorination product of ethanol, the so-called "chlorine oil", contains, besides chloral, other products of partial chlorination and oxidation of alcohol: dichloro acetaldehyde, its hydrates and alcoholates, acetals, dichloro acetic acid, its esters, etc. The determination of the content of dichloro acetaldehyde is important for the control of the chlorination process. It is, however, not possible by chemical methods in the presence of chloral. Proceeding from a paper by Ph. Elving, E. Bannet (Ref. 3: Anal. Chem., 26, 10, 1572 (1954)), the polarographic determination of dichloro acetaldehyde in a mixture with

TITLE: High frequency oscillations excited during electron beam interaction with plasma

SOURCE: AN UkrSSR. Vzaimodeystviye puchkov zaryazhennykh chastits s plazmoy (Interaction of charged particle beams with plasma). Kiev, Naukova dumka, 1965, 7-23

TOPIC TAGS: HF oscillator, plasma heating, electron beam, cyclotron frequency

ABSTRACT: The generation of oscillations in a plasma and the electron beam traversing the plasma and the study of the resulting waves are described. The experiments were conducted with the plasma frequency smaller than that of the electron cyclotron frequency. A beam current of 8.5 and 5 A and a magnetic field in the range of 720-1320 oe (parallel to current) were used. The frequencies generated in the experiment were determined by magnetic probes and wavemeters. All three spatial components were determined. The frequency spectrum of 400 to 3200 cps was measured. These measurements show that the intensity of the generated waves in the beam depend on the ambient pressure. At higher pressure values, a characteristic plateau was found. The wave intensity was also found to increase in the beam direction, and to decrease as the magnetic field decreased. These results are discussed and compared with the theoretical predic-

I. Shevchenko at this institute for the case of beams of not very large density, a nonlinear theory has been created which permits one to trace the process of interaction of an initially nonmodulated beam and mono-energetic beam with a plasma from the initial stage to saturation. As is shown, a large part of the beam's energy of ordered motion (75% of its initial energy) is lost by the beam as a result of collective interactions with the plasma. Thus the energy expended upon excitation of oscillations amounts to 30%; upon increasing the thermal energy of the plasma, to 30%; and upon increasing the thermal energy of beam, to 15%. The experimental investigations of this interaction were carried out by I. F. Kharchenko and A. K. Berezin and their respective co-workers. Their results are in agreement with the theory of M. F. Gorbatenko. The mentioned institute has also carried out further theoretical and experimental investigations on the problems of electromagnetic wave propagation in plasma waveguides excited by high-frequency wall sources. The experimental studies, by O. G. Zagorodnov, et al., showed that the results agree well with theory under conditions of insignificant nonlinear effects. Current experiments are concerned with highly-ionized plasmas with density  $10^{11}$  to  $10^{12}$ . Orig. art. has 4 figures, 1 table.

Card 4/5

L 4242-66

ACCESSION NR: AT5007973

crease in the high-frequency energy losses. It is also important to concentrate the electromagnetic energy in the radial direction only in the regions where the accelerated particles are moving. Thus for a given field strength the electromagnetic energy flux decreases markedly. If the fluxes of accelerated particles are large, the waveguide properties necessary for acceleration can be ensured by the particles of the beam which are not entrapped in the acceleration process, through which particles the entrapped particles move. The beam itself which is injected into the accelerator operates under these conditions of an accelerating system. To clarify the possibilities of particle acceleration by means of electromagnetic waves excited by charged particle beams, and also to investigate the influence of beam instabilities upon the acceleration process, the Physicotechnical Institute, Academy of Sciences Ukrainian SSR conducted theoretical and experimental investigations on the interaction of charged particle beams with a plasma. These investigations were intended to lead to, not the design and construction of a definite accelerator model, but the physical processes occurring during the interaction under consideration, and in this way to a determination of the possibilities of plasma methods of acceleration which are being developed at this institute. The theory developed up to the present time of the interaction between beams and plasma has been essentially a linear theory. As a result of the work of V. D. Shapiro and V.

paratively small plasma densities around  $10^9$  to  $10^{13}$  cm $^{-3}$ ). Under these conditions the high-frequency energy losses during wave propagation, which are due to the collisions of plasma particles, are small. The density of electrons in metals (about  $10^{23}$ ) is many orders greater than is necessary for ensuring waveguide properties in the microwave range. This leads to great losses of high-frequency power during wave propagation in metallic conductors. For plasma densities around  $10^9$  to  $10^{13}$  cm $^{-3}$ , the energy losses during particle transit through the plasma, which are proportional to plasma density, are insignificant, from  $10^{-5}$  to  $10^{-6}$  ev/cm. This means that plasma waveguides are "transparent" for accelerated particles. According to the conditions of acceleration the particles are divided into individual bunches. Thus the loss of particles moving in the plasma can increase greatly because of the occurrence of coherent deceleration representing the inverse of the effect of coherent acceleration, which was established by V. I. Veksler (Symposium CERN 1, 80 (1956)). However, even for accelerated particle fluxes of the order of tens of amperes, these losses are all insignificant. Because waveguide properties are determined by the plasma, the metal surfaces can be remote from regions with large field strengths or eliminated altogether, which permits a significant increase in the permissible voltages of the accelerating fields and a substantial de-

 waveguide

ABSTRACT: Plasma waveguides and noncompensated electron and ion beams can be utilized as accelerating systems in linear accelerators (Faynberg, Ya. B., Symposium CERN 1, 84 1956); *Atomnaya energiya* 6, 431 (1959)). In such systems, slow electromagnetic waves which are propagated, which are necessary for particle acceleration. The waveguide properties of restrained plasma and noncompensated beams are displayed in the case of waves in the meter and centimeter range even for com-
